Outlet pipework

This is the pipe that runs from your gas meter to feed your gas appliances.

As part of our work we can install a maximum of two metres of pipe between the new meter location and your existing outlet pipework (this distance is the actual length of pipe required and isn't necessarily the shortest distance between the two locations).

Where pipes have to pass a doorway, we won't lift any flooring (carpets or floorboards) to shorten the distance, so the pipes will have to pass around the doorframe.

We won't chase out floors or walls to conceal pipes, and we won't carry out any specialist drilling (such as diamond drilling). For this type of work you'll need to get a Gas Safe registered engineer to do the work. You'll find details of local engineers at gassaferegister.co.uk or by calling **0800 408 5500**.

* This is the pipework that connects the meter installation to your gas appliances and is the responsibility of the homeowner.
